

Reference Guide

The OS for AI-Powered Work

Build, save, and reuse AI workflows to automate your work.

Stop repeating prompts. Start building workflows.

Table of Contents

1. Getting Started

What is AI Workspace, key concepts, first steps

2. Workflow Builder

Canvas, blocks, connections, running workflows

3. Block Types

Input, AI, Transform, Condition, Memory, Review, Export

4. Variables System

Creating, using, and scoping variables

5. Brand Memory

Setting up and using brand context

6. Templates

Using, customizing, and saving templates

7. Projects & Workspaces

Organizing your work

8. Assets

Uploading and managing files

9. Team Collaboration

Inviting members, roles, approvals

10. Billing & Plans

Free, Pro, Business plans compared

11. Admin Panel

AI provider settings, user management

12. Tips & Best Practices

Getting the most from AI Workspace

1. Getting Started

What is AI Workspace?

AI Workspace is a visual workflow platform that lets you build, save, and reuse AI-powered automations. Instead of opening ChatGPT or Claude repeatedly and retyping the same prompts, you create a workflow once — a chain of steps — and run it with any new input in one click.

Think of it as **Visual Studio Code for AI work**. Just as developers write code once and run it many times, you build AI workflows once and reuse them forever.

Key Concepts

Workflow	A chain of blocks that processes input and produces output. Built once, reused with any new input.
Block	A single step in a workflow. Each block has a type (Input, AI, Transform, etc.), settings, and produces an output passed to the next block.
Run	One execution of a workflow. Every run is saved with its full input, all step outputs, duration, and status.
Project	A folder that groups related workflows, assets, and files together.
Workspace	Your top-level account environment. Contains all projects, memory, team members, and settings.
Memory	Stored context (brand voice, tone, audience, etc.) that AI blocks can automatically reference for consistent outputs.
Variables	Reusable placeholders like {{brand_name}} that make workflows adaptable to different inputs without rebuilding them.
Template	A pre-built workflow you can use immediately and customize for your needs.

Onboarding: 7 Steps

Step	Action	Details
Step 1	Choose your goal	Content Creation, Marketing, Research, Documentation, Business, or Custom
Step 2	Create Workspace	Name your workspace and set your timezone
Step 3	Create First Project	Marketing, Startup, YouTube, Personal, or Client

Step 4	Choose a Template	Blog Generator, Startup Launch, Research Assistant, or start blank
Step 5	Connect AI	Use platform AI (Groq, free) or bring your own API key (Pro)
Step 6	Run First Workflow	Type input, click Run, watch live execution
Step 7	Success	View outputs, explore templates, upgrade if needed

2. Workflow Builder

The Canvas

The workflow builder is an infinite canvas where you visually design your automation. Blocks sit on the canvas and are connected by animated teal lines showing the flow of data.

Canvas Navigation

Zoom In / Out: Scroll wheel or pinch gesture

Pan / Move Canvas: Middle mouse button drag, or Alt + drag

Select Block: Click on any block

Multi-Select: Shift + click, or drag a selection box

Delete Selected: Delete or Backspace key

Undo: Ctrl + Z

Redo: Ctrl + Y

Auto-Layout: Click the auto-layout button in toolbar (arranges blocks neatly)

Mini-Map: Toggle in bottom-right corner for bird's-eye view

Snap to Grid: Blocks automatically snap to 16px grid

Toolbar

Workflow Name: Click to edit inline — saves automatically

Save Status: Shows "Saved", "Saving...", or "Unsaved changes"

Undo / Redo: Step through change history

Run Button: Teal button — triggers workflow execution

Share: Generate a shareable link (coming soon)

Building a Workflow

1. Open or create a workflow from the Workflows page
2. Drag a block from the left panel onto the canvas
3. Configure the block using the right settings panel
4. Add another block and drag from the first block's output port to the second's input port
5. Repeat until your workflow is complete
6. Click Run to execute — watch the Run Panel at the bottom for live progress
7. View outputs in the Run Panel or visit Runs page for full history

TIP: Start with a Template instead of blank. Pick one close to your use case, then customize the blocks. Much faster than building from scratch.

3. Block Types

Every workflow is built from 7 block types. Each block takes an input, processes it, and passes output to the next connected block.

[IN] Input Block

What it does	The starting point of every workflow. Accepts user-provided content.
Inputs	Text, file upload, URL, form fields, or variable values
Outputs	Raw content string passed to the next block
Example use	User pastes a YouTube video description to start a content workflow

[AI] AI Block

What it does	Sends a prompt to an AI model (Groq, Claude, GPT, Gemini) and returns the response.
Inputs	System prompt, user prompt (with {{variables}}), model, temperature, max tokens
Outputs	AI-generated text response (streamed in real-time)
Example use	Generate a Twitter thread from a blog post summary

[TX] Transform Block

What it does	Processes text without AI — summarize, rewrite, translate, extract, merge, split, format.
Inputs	Input text + transform type + settings (target language, word count, etc.)
Outputs	Transformed text
Example use	Summarize a 2,000-word blog post to 150 words before sending to social generator

[IF] Condition Block

What it does	Adds if/else logic to route workflow based on output length, content, or variable values.
Inputs	Input text or variable + condition (length, contains keyword, equals value)
Outputs	Routes to True path or False path
Example use	If output is longer than 280 characters, route to a summarize block first

[MEM] Memory Block

What it does	Read from or write to Brand Memory. Inject saved context into workflow.
Inputs	Memory key to read/write, optional value to save
Outputs	Retrieved memory value (if reading)
Example use	Read {{brand_name}} and {{tone}} from memory to inject into AI prompts

[REV] Review Block

What it does	Pauses the workflow for human review. You approve, edit, or reject before continuing.
Inputs	AI output from previous block
Outputs	Approved or edited content (workflow resumes on approval)
Example use	Review AI-generated ad copy before it continues to the export block

[EXP] Export Block

What it does	Saves or exports the final output in your chosen format.
Inputs	Final output text + export format (PDF, Markdown, DOCX, JSON, clipboard)
Outputs	Downloadable file or clipboard copy
Example use	Export the completed blog post as a PDF with custom filename

NOTE: Integration blocks (Email, Slack, Notion, Webhooks) are coming soon. They appear as "Coming Soon" placeholders in the block picker.

4. Variables System

Variables make your workflows reusable. Instead of hardcoding values like your brand name or audience in every prompt, define them once and reference them with `{{variable_name}}` syntax anywhere in the workflow.

Variable Scopes

Variables exist at 4 levels. More specific scopes override broader ones.

Scope	Where it works	Example variables
Workspace	Available in ALL projects and workflows	<code>{{brand_name}}</code> , <code>{{website}}</code> , <code>{{audience}}</code>
Project	Available only within one project	<code>{{campaign_goal}}</code> , <code>{{product_name}}</code>
Workflow	Available only within one workflow	<code>{{output_format}}</code> , <code>{{word_count}}</code>
Runtime	Set by user when triggering a run	<code>{{topic}}</code> , <code>{{target_date}}</code>

System Variables (Auto-Available)

These are automatically available in every workflow — no setup needed:

- `{{current_date}}` — Today's date (e.g., July 2, 2026)
- `{{current_time}}` — Current time (e.g., 09:41 AM)
- `{{current_datetime}}` — Full date and time
- `{{user_name}}` — Name of the logged-in user
- `{{workspace_name}}` — Name of the current workspace
- `{{run_number}}` — How many times this workflow has been run

Using Variables in Prompts

In any AI block prompt field, type double curly braces around your variable name:

```
Write a blog post about {{topic}} for {{audience}}. Brand: {{brand_name}}.
Tone: {{tone}}. Language: {{language}}. Date: {{current_date}}
```

TIP: Use the variable picker in the block settings panel (right side). Click any variable to insert it at your cursor position.

5. Brand Memory

Brand Memory stores your brand context so every AI block produces consistent, on-brand outputs without you repeating yourself in every prompt.

Memory Sections

Brand Identity	<code>{{brand_name}}</code>, <code>{{tagline}}</code>, <code>{{website}}</code>, <code>{{industry}}</code> Core brand information used across all content
Audience	<code>{{audience}}</code>, <code>{{demographics}}</code>, <code>{{pain_points}}</code> Who you're speaking to in every piece of content
Voice & Tone	<code>{{tone}}</code>, <code>{{language}}</code>, Do's, Don'ts How your brand communicates — casual, professional, friendly, technical
Products	<code>{{product}}</code>, <code>{{product_description}}</code>, <code>{{features}}</code>, <code>{{pricing}}</code> What you're selling or promoting
Uploaded Files	PDFs, DOCX, brand guidelines Documents AI blocks can reference for accurate information
Saved Outputs	Previous AI-generated content Reusable snippets from past workflow runs

How to Use Memory in Workflows

1. Go to Memory page and fill in your brand details
2. In a workflow, add a Memory block before your AI blocks
3. Configure the Memory block to read the keys you need
4. In your AI block prompt, reference those variables: "Tone: `{{tone}}`, Brand: `{{brand_name}}`"
5. Toggle "Use Memory" in the AI block settings for automatic injection
6. Every run will now use your saved brand context automatically

TIP: Fill in Memory before building workflows. It's the single most impactful setup step — consistent brand voice across hundreds of AI outputs.

6. Templates

Templates are pre-built workflows ready to use immediately. Pick one, customize the prompts, and run it with your content.

Built-in Templates

Blog Generator	<i>For: Content Creators, Marketers</i>
Input (topic) -> Research (AI) -> Outline (AI) -> Write Blog (AI) -> SEO Optimize (AI) -> Export (MD)	
Startup Launch Kit	<i>For: Founders, Entrepreneurs</i>
Input (idea) -> Market Research -> SWOT Analysis -> Landing Page Copy -> Blog Post -> Social Posts -> Export	
YouTube to Social	<i>For: Content Creators, YouTubers</i>
Input (video title) -> Script -> Twitter Thread -> LinkedIn Post -> Instagram Caption -> Newsletter -> Export	
Research Assistant	<i>For: Researchers, Analysts</i>
Input (topic) -> Research (AI) -> Summarize (Transform) -> Key Insights (AI) -> Report (AI) -> Export (PDF)	
Marketing Campaign	<i>For: Marketing Teams</i>
Input (product) -> Audience Analysis -> Strategy -> Ad Copy -> Email Sequence -> Social Content -> Export	
Meeting Notes	<i>For: Teams, Project Managers</i>
Input (raw notes) -> Clean Up (Transform) -> Action Items (AI) -> Summary (AI) -> Export (DOCX)	

Using a Template

1. Go to Templates page
2. Browse by category (Creator, Founder, Business, Research, Developer)
3. Click Preview to see the workflow blocks before using
4. Click "Use Template" — it copies to your selected project as a new workflow
5. Open the workflow, customize prompts for your brand
6. Run with your content

7. Projects & Workspaces

Structure Overview

Use **Projects** to group related work. For example: one project per client, per product launch, or per content channel. Each project has its own workflows, assets, and variables.

TIP: Create one project per major initiative. "YouTube Channel", "Client: Acme Corp", "Product Launch Q3" — keeps workflows organized and searchable.

8. Assets

Assets are files you upload for use in workflows — brand guidelines, product images, reference PDFs, logos, and more.

Supported File Types

Images: JPG, PNG, GIF, SVG, WebP — logos, product photos, graphics

Documents: PDF, DOCX, TXT — brand guidelines, SOPs, reference docs

Videos: MP4, MOV — product demos, tutorials

Audio: MP3, WAV — podcasts, voiceovers

Spreadsheets: XLSX, CSV — data, lists, pricing tables

Presentations: PPTX — slide decks, pitch materials

Asset Features

- Grid or list view (toggle top right)
- Search by name or tag
- Filter by file type
- Organize into folders
- Add tags for easy discovery
- Preview files before use
- See which workflows use each asset
- Version history (replace file, keep history)
- Storage meter (shown at top of Assets page)

9. Team Collaboration

Inviting Team Members

1. Go to Team page
2. Click "Invite Member"
3. Enter email address(es)
4. Select role (Admin, Editor, or Viewer)
5. Click Send Invite — they receive an email with a join link
6. Pending invites shown until accepted

Roles Explained

Role	Access Level	Can Do
Admin	Full access	Manage team, billing, all workflows, all settings
Editor	Create & run	Create, edit, and run workflows. No billing or team management
Viewer	Read only	View workflows and run history. Cannot create or run

Approval Workflow

Use Review blocks to create human-in-the-loop approval workflows:

- Editor creates and runs a workflow — it pauses at the Review block
- Admin/Manager receives a notification to review
- Manager opens the run, reviews the AI output
- Manager approves (workflow continues to Export) or rejects (workflow stops)
- Optional: Manager edits the content before approving

10. Billing & Plans

AI Workspace offers three plans. Start free, upgrade when you need more runs, storage, or team members.

Feature	Free	Pro - Rs.999/mo	Business - Rs.4,999/mo
Projects	3	Unlimited	Unlimited
Workflows	3	Unlimited	Unlimited
Runs / month	10	1,000	Unlimited
AI Tokens / month	50,000	Included	Included
Storage	100 MB	10 GB	100 GB
Team Members	1	5	Unlimited
Brand Memory	No	Yes	Yes
Version History	No	Yes	Yes
Own API Key	No	Yes	Yes
Shared Memory	No	No	Yes
Audit Logs	No	No	Yes
API Access	No	No	Yes
Priority Support	No	Yes	Yes

Upgrading

1. Go to Settings -> Billing
2. Click "Upgrade to Pro" or "Upgrade to Business"
3. Complete checkout via Razorpay (UPI, cards, net banking)
4. Plan activates immediately after payment
5. All limits update instantly — no restart needed

Bringing Your Own API Key (Pro+)

Pro and Business users can connect their own AI provider API keys. This gives you control over which model you use and your own token limits.

1. Go to Settings -> AI Provider
2. Select "Use My Own API Key"
3. Choose provider (Groq, Anthropic, OpenAI, Gemini)
4. Enter your API key (encrypted, never shared)

5. Select your preferred model
6. Click Test Connection to verify
7. Save — all your future runs use your key

11. Admin Panel

The Admin Panel (/admin) is accessible only to platform administrators. It gives you full control over the platform, AI providers, users, and templates.

AI Provider Settings

This is the most important admin feature — switch AI providers and models without touching any code.

1. Go to /admin/settings/ai
2. Select Active Provider (Groq, Anthropic, OpenAI, Gemini)
3. Enter API key for that provider (masked after saving)
4. Select Default Model from dropdown
5. Set Fallback Provider (used if primary fails)
6. Click Test Connection to verify it works
7. Click Save — takes effect immediately for ALL users

Available AI Providers & Models

Provider	Models	Best For
Groq	llama-3.3-70b-versatile (recommended), llama-3.1-8b-instant, mixtral-8x7b-32768, gemma2-9b-it	Fast, free tier, great quality
Anthropic	claude-sonnet-4-6 (recommended), claude-opus-4-8, claude-haiku-4-5-20251001	Best quality, best reasoning
OpenAI	gpt-4o (recommended), gpt-4o-mini, gpt-4-turbo	Widely compatible, well-tested
Gemini	gemini-1.5-pro (recommended), gemini-1.5-flash, gemini-2.0-flash	Google ecosystem, fast flash models

Model Resolution Order

When a workflow runs, the AI model is selected in this priority order:

Priority	Source	Condition
1st	Block-level model	If the AI block has a specific model set
2nd	User custom provider	If user enabled their own API key (Pro+)
3rd	Admin active provider	Default for all users (set in admin panel)
4th	Fallback provider	If primary provider fails or is unreachable
5th	Error returned	If all providers fail, run shows error with message

Other Admin Functions

User Management (/admin/users): View all users, change plans, make admin, suspend accounts

Template Management (/admin/templates): Enable/disable templates, add new platform templates

Audit Logs (/admin/logs): Full paginated activity log — who did what, when

Platform Stats (/admin): Total users, subscriptions, runs today, system status

12. Tips & Best Practices

1	Fill Memory First Before building any workflow, go to Memory and fill in all 6 sections. This makes every workflow you build instantly brand-consistent.
2	Start with Templates Don't build from scratch. Pick the closest template, use it once, then customize the prompts. Saves 80% of setup time.
3	Use Variables Everywhere Replace any hardcoded text in prompts (brand name, audience, tone) with {{variables}}. Makes workflows reusable for multiple clients or campaigns.
4	Keep AI Block Prompts Specific Vague prompts give vague output. Include: format, length, tone, audience, and what NOT to include. Specificity = quality.
5	Use Transform Before AI If your input is very long (article, transcript), add a Summarize transform block before the AI block. Reduces tokens and improves focus.
6	Add Review Blocks for Critical Content For anything public-facing (ads, landing pages, email campaigns), add a Review block before Export. Human review = brand safety.
7	Run History is Your Archive Every run is saved forever. Use Runs page as your content archive. Search, rerun, or export any past output at any time.
8	Test Connection After Changing Providers After updating AI provider in admin panel, always click Test Connection before announcing changes to users.
9	Name Workflows Clearly "Blog Generator v2" not "Workflow 1". You'll have dozens soon. Clear names save time when searching.

Export Everything

Use Export blocks at the end of every workflow. PDF for sharing, Markdown for Notion/GitHub, JSON for developers. Always have the data.

Quick Reference

Keyboard Shortcuts

Shortcut	Action
Ctrl + Z	Undo
Ctrl + Y	Redo
Delete / Backspace	Delete selected block
Ctrl + A	Select all blocks
Scroll wheel	Zoom in/out on canvas
Alt + Drag	Pan canvas
Shift + Click	Multi-select blocks
Escape	Deselect / close panel

Common Workflow Patterns

Content Repurposing

Input -> AI (adapt for platform) -> Export

One piece of content, multiple platform versions

Research to Report

Input -> AI (research) -> Transform (summarize) -> AI (report) -> Export PDF

Turn a topic into a structured report

Quality Gated

Input -> AI (generate) -> Condition (length check) -> Review -> Export

Ensure outputs meet criteria before export

Brand Consistent

Memory (read brand) -> Input -> AI (with brand context) -> Export

Every output follows brand guidelines automatically

Multi-Format Export

Input -> AI -> Export (PDF) + Export (MD) + Export (JSON)

Same content saved in multiple formats

AI Workspace

The OS for AI-Powered Work

Build workflows once. Run them forever.

Version 1.0 | July 2026
